Sinch

Dear Hiring Team,

For ten years, I was the primary HRIT owner for L'Oréal's global SAP HR platform: forty countries in a single instance, running payroll, time management, talent, and organisational management simultaneously; the last three of those years were spent leading the data migration from SAP HR to SuccessFactors across that entire footprint. Designing solutions that had to hold up across forty different legal and payroll frameworks in the same release cycle is where I built my understanding of global HR architecture.

That experience covers most of what this role asks for. I have spent a decade translating business requirements into system design across a distributed global workforce, and I know the difference between a solution that looks clean in a workshop and one that actually survives a go live in six countries at once. The 80/20 split between execution and strategy makes sense to me: most of the job is making the architecture hold in practice, not in the diagram.

One gap I want to name: my HRIT background is built on SAP HR and SuccessFactors; Oracle HCM is different territory, and I would be starting that part from scratch. What transfers is the rest: how to model multi-country HR processes, how to manage solution scope when every country team thinks their payroll is the special case, how to keep architecture integrity intact through a long rollout. I deployed SAP SuccessFactors across forty countries at L'Oréal; moving between cloud HCM suites is a shorter distance than it might look on paper.

I also co-founded WallOfTraders.com, a SaaS trading platform I built from scratch. It gave me a direct sense of how product decisions get made under real constraints, which helps when working with engineering teams who have heard too many consultants describe architecture from the outside.

I'd genuinely enjoy a conversation about the role.

Yours sincerely,

**Gaëtan François**
