Constructor

Dear Hiring Team,

For ten years I sat between L'Oréal's HR business teams and the developers building for them, across forty countries running on one platform. My job was to make integrations land: work out what the business actually needed, write the specification, arbitrate what got built, then stay with the release through go-live and the support queue that followed. That is where I learned that the real cost of an integration surfaces months later, in the defects nobody instrumented for and the escalations that end up on a sponsor's desk.

Time-to-value gets decided long before go-live, in how clearly the setup path is written down and in how much of the diagnosis a customer can do before opening a ticket. On OneProfile I owned that path across forty countries; on OnePayroll I ran the data migration into production. Both jobs taught me to treat a broken data flow as something to design out of the product, since the support queue only ever shows you the symptom.

I should be straight about the gap. I have never held a Product Manager title, and SDKs and web tracking instrumentation are outside what I have shipped. My product ownership comes from WallofTraders.com, the SaaS platform I co-founded and ran as CEO, where I decided what shipped, specified it, and checked it against how users actually behaved. That is real product work at a smaller scale. Attribution and browser constraints would be new territory, and I would be learning those specifics on the job.

The engineering side of me is still active. I hold a Master's in Applied Mathematics, I write Python, and I trained in machine learning before applying it to a scraping and prediction project of my own. I have also run SEO and paid acquisition, which is where I got used to arguing with my own numbers when the data was thin. Translating between engineers and the customer-facing teams is what I did for a decade, and I would happily do it again.

I'd genuinely enjoy a conversation about the role.

Kind regards,

Gaëtan FRANÇOIS
